

Louisiana Energy Facts Annual

Department of Natural Resources
Technology Assessment Division
March 1, 2021

This issue of **Louisiana Energy Facts Annual - 2020** is funded 100% (\$XXXX) with Petroleum Violation Escrow funds as part of the State Energy Conservation Program as approved by the U.S. Department of Energy and the Department of Natural Resources.

This public document was published at a total cost of \$XXXX. XXX copies of this public document were published in this first printing at a total cost of \$XXXX. The total cost of all printings of this document, including reprints is \$XXXX. This document was published by the Department of Natural Resources, P.O. Box 94396, Baton Rouge, LA 70804-9396, to promulgate the State Energy Conservation Plan developed under authority of P.L. 94-163. This material was printed in accordance with the standards for printing by state agencies pursuant to R.S. 43:31.

LOUISIANA ENERGY FACTS

ANNUAL 2020

Department of Natural Resources
Thomas Harris
Secretary of Natural Resources

General Questions and Comments

The **Louisiana Energy Facts Annual - 2020(Annual)** was published by the Technology Assessment Division of the Louisiana Department of Natural Resources under the direction of Edward O'Brien. The division director is Jason Lanclos.

General questions and comments regarding the **Annual** may be referred to Technology Assessment Division staff at (225) 342-1270. Questions concerning specific areas of the **Annual** may be directed to the Technology Assessment Division staff members listed below.

Oil & gas production, drilling, revenue, reserves, prices, electric utilities, coal and lignite, and general energy statistics:

Edward O'Brien.
Senior Economist
(225) 342-8573
E-mail: Edward.OBrien@la.gov

Additional copies of this document may be obtained by contacting:

Louisiana Energy Facts Annual 2020

INTRODUCTION

ABOUT THIS PUBLICATION

The **Louisiana Energy Facts Annual (Annual)** is published to provide a comprehensive compendium of Louisiana related energy production and use statistics on a yearly basis. The data tables are supplemented with numerous graphs and charts to aid in the interpretation of the data and the discernment of trends. The **Annual** is published as soon as sufficient data for the previous calendar year is available. Due to time lags in the availability of some of the data, there is approximately a six month lag before the current **Annual** can be published. Some changes have been introduced in order to incorporate the latest available data.

If you read our monthly **Louisiana Energy Facts** newsletter, you may find that some of the previously published data has been revised in the **Annual**. This data, by its nature, continues to be revised, sometimes years after its initial publication. We try to bring attention to these changes by marking them as revisions.

The most recent **Louisiana Energy Facts** monthly newsletter may contain even more updates. Please refer to the recent monthlies for the very latest data. The **Louisiana Energy Facts** monthly newsletter is available online at our website:

<http://www.dnr.louisiana.gov/tad>

❖ For newsletters, select:

[Newsletter](#) then [Louisiana Energy Facts](#)

❖ For Louisiana Energy Facts Annual Reports in PDF format, select:

[Reports](#) then [Energy Facts Annuals](#)

❖ For tables covering longer time periods than in the Louisiana Energy Facts Reports, select:

[Facts & Figures](#)

Note: the data in these tables will be updated throughout the year. The data files are not audited and will change as more reliable data becomes available.

The Technology Assessment Division is not the source of the data, but merely reports data provided to us by the responsible agency. We understand that users of our time series data need consistency and, for that reason, our time series have been adjusted backward to reflect these new modifications.

Additional comments or suggestions about this publication can be directed to the Technology Assessment Division staff members listed on the General Questions and Comments page.

We hope you find this document useful, and we appreciate your feedback. Please fill in, detach and return the survey form at the back of this report.

2020 HIGHLIGHTS

The data in the 2020 **Louisiana Energy Facts Annual** contains some recent trends.

Crude Oil and Natural Gas Prices

Gas spot price average was \$2.16 per MCF in 2020, and it was \$2.73 per MCF in 2019; which is 20.9% lower than in 2019. The Louisiana natural gas spot market average in January 2020 was \$2.24 per MCF and increased to \$3.01 per MCF in December 2020. The January price was attributed to a warmer than normal winter and the price increase at the end of 2020 was caused by excess demand compared to past years. The average price for gas for 2021 is expected to be around \$2.50 per MCF.

Light Louisiana Sweet (LLS) average spot crude oil price was \$38.72 per barrel in 2020 and it was \$62.49 per barrel in 2019, a 38.0% decrease. The LLS crude oil spot price average was \$31.38 per barrel in January 2020 and rose to \$48.94 per barrel in December 2020. The oil price increase was caused by more robust export market for US crude after the lows of the COVID-19 pandemic. The 2020 LLS average spot price is expected to be around \$59 per barrel.

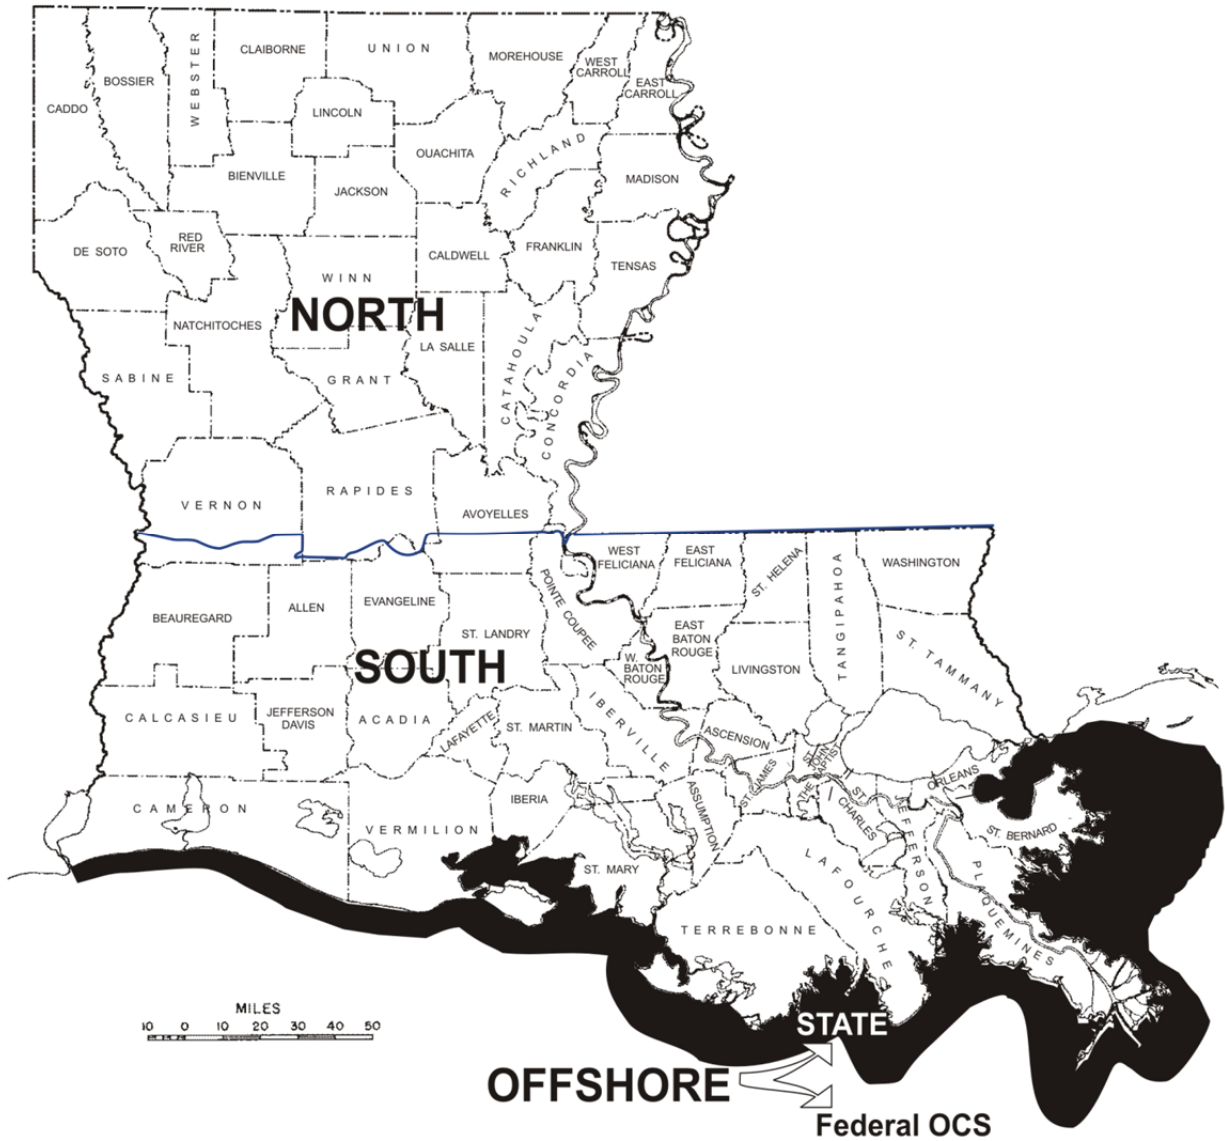

Oil and Gas Production

Louisiana state oil production was lower in 2020 than in 2019, while the federal Outer Continental Shelf (OCS) in the Gulf of Mexico (GOM) increased production. The Louisiana state crude oil and condensate production, excluding the federal OCS, was 36.2 million barrels (MMB) in 2020 and it was 47.3 MMB in 2019. The 2020 oil production was 11.0 MMB or 23.3% lower than 2019. The preliminary Central GOM oil production in 2020 is 566.0 MMB and it was 93.7 MMB or 14.2% lower than 2019 oil production. The decrease in Central GOM oil was greatly impacted by the decrease in demand from the COVID-19 pandemic, and the hurricanes which impacted the Louisiana coast.

Louisiana gas production was higher in 2019 than in 2020. The Louisiana state natural gas and casinghead, excluding OCS production, was 3.0 TCF in 2020, 3.5% lower than 2019. The decrease in gas was driven by a decrease in demand due to the COVID-19 pandemic.

The Haynesville shale is producing around 75% of the state total gas production. The preliminary Central GOM gas production in 2020 is about 0.8 TCF, and expected to maintain production in 2021. The Central GOM gas production has decreased over the years due to shifting priorities from gas fields to oil fields offshore.

SUBDIVISIONS OF LOUISIANA

Drilling

Louisiana rig count, including the OCS area, averaged 40 active rigs in 2020, 35.2% lower than in 2019. In state areas, state offshore region drilling rigs was almost non-existent in 2020, South LA Inland water was lower in 2020 than in 2019, South LA inland land showed a 3 rig decrease in 2019, North LA region showed decreased by 10 rigs in 2020, and LA Federal OCS average showed a 7 rig decrease in 2020 from 2019.

Other significant items

Louisiana refineries 2020 daily crude oil average runs to stills were 2.95 million barrels per day, marginally decreasing from the 2019 daily production due to demand constraints due to the pandemic, and the hurricanes which impacted Louisiana in the summer and fall of 2020.

Average employment in the oil and gas extraction industries was 34,921 in 2019; a marginal increase from 2018, due to increases in exploration and production and refining activities.

Louisiana proved oil reserves were slightly lower in 2019 than in 2018, due to decreases in the North Louisiana region. The decrease in oil reserve was due to reservoir adjustments in accordance as a reflection on recoverable resources. Louisiana proved gas reserves were higher in 2019 than in 2018 in all Louisiana regions with the exception of the South Onshore region. The increase in gas reserves were the result of steady gas exploration activities in Louisiana regions.

Federal OCS: See footnotes on Appendix B "OCSLA" & "GOMESA"

Federal Onshore: Revenue distributed to the state under section 35 of the Mineral Leasing Act (MLA). MLA provides to the state 50% of mineral revenue from federal lands located within the state boundaries. Revenues came from royalties, rents and bonuses. It is fiscal year data. Oil and gas produced on federal onshore pay severance tax to the state by the producer on the non-royalty share of the production, and the royalty share of the production is exempted.

State Boundaries: Revenue from mineral production such as bonuses, override royalties, rents, royalties and severance taxes within state boundaries.

An Explanation of Changes in Oil and Gas Statistics

Note # 1

Current production data and all future reports will reflect changes due to modifications in the reporting system by the Department of Natural Resources Office of Conservation, Production Audit Section. Only the oil and gas production data in state jurisdiction is affected.

The new data for oil will not include crude oil, condensate or raw make recovered from natural gas processing plants. In the past, these products were added to the state production as crude oil or condensate.

A separate report on gas plants liquids production is not available at the present.

In addition, the gas data system has been adjusted to reflect reporting production on the date produced. Previously, it had been reported on the date first purchased.

The new reporting system should produce more accurate and timely data.

The Technology Assessment Division is not the source of these data sets, but merely reports data provided to us by the Office of Conservation. However, we understand that users of our time series data need consistency over time. For that reason, our time series has been adjusted backwards to 1980 using these new definitions.

Note # 2

Producing oil and gas well data since 2000 reflect changes due to modifications in the reporting system by the Department of Natural Resources Office of Conservation.

The new data for oil and natural gas producing wells count them as productive if they had any production in the month, previous system counted only the producing wells at the end of the month. The new reporting system should produce more accurate and timely data.

The Technology Assessment Division is not the source of these data sets, but merely reports data provided to us by the Office of Conservation. However, we understand that users of our time series data need consistency over time, but due to lack of accurate information the time series has been adjusted backwards to 2000 using the new system.

Other factors that affected the big increase on wells numbers are the big jump on energy prices around 2000, and the inactive wells

Outer Continental Shelf Lands Act (OCSLA)

The OCSLA of 1953 (67 Stat. 462), as amended (43 U.S.C. 1331 et seq. (1988)) established Federal jurisdiction over submerged lands on the Outer Continental Shelf (OCS) seaward of State boundaries. Under the OCSLA, the Secretary of the Interior is responsible for the administration of mineral exploration and development of the OCS. The Act empowers the Secretary to grant leases to the highest qualified responsible bidder(s) on the basis of sealed competitive bids and to formulate such regulations as necessary to carry out the provisions of the Act. The Act, as amended, provides guidelines for implementing an OCS oil and gas exploration and development program. The basic goals of the Act include the following:

1. To establish policies and procedures for managing the oil and natural gas resources of the OCS that are intended to result in expedited exploration and development of the OCS in order to achieve national economic and energy policy goals, assure national security, reduce dependence on foreign sources, and maintain a favorable balance of payments in world trade.
2. To preserve, protect, and develop oil and natural gas resources of the OCS in a manner that is consistent with the need
 - (a) to make such resources available to meet the nation's energy needs as rapidly as possible;
 - (b) to balance orderly resource development with protection of the human, marine, and coastal environments;
 - (c) to ensure the public a fair and equitable return on the resources of the OCS;
 - (d) to preserve and maintain free enterprise competition.
3. To encourage development of new and improved technology for energy resource production, this will eliminate or minimize risk of damage to the human, marine, and coastal environments.

Royalty revenues from Federal offshore leases on the OCS are distributed to the Land and Water Conservation Fund, the Historic Preservation Fund, and the General Fund of the U.S. Treasury. Transfers are made in each fiscal year from OCS royalties, rentals and bonuses in order to maintain the Land and Water Conservation Fund's annual authorization of \$900 million. Annually, \$150 million is put into the Historic Preservation Fund. The balance of offshore revenue receipts is directed to the General Fund of the U.S. Treasury.

Section 8(g) of the OCSLA Amendments of 1978 provided that the states were to receive a "fair and equitable" division of revenues generated from the leasing of lands within 3 miles of the seaward boundary of a coastal state that contains one or more oil and gas pools or fields underlying both the OCS and lands subject to the jurisdiction of the state. The states and the federal government, however, were unable to reach agreement concerning the meaning of the term "fair and equitable." Revenues

generated in the 3-mile boundary zone were subsequently placed into an escrow fund in August 1979.

Congress resolved the dispute over the meaning of "fair and equitable" in the Outer Continental Shelf Lands Act Amendments of 1985, Public Law 99-272. The amendments required that the affected coastal state will receive 27 percent of the revenues generated from the leasing and development of oil and natural gas resources located in the Federal 8(g) zone. The law provided for the following distribution of revenues to Louisiana under section 8(g):

Before 1986: Louisiana did not receive any shared revenue from OCS production prior to 1986.

1986: Louisiana received a payment of \$68.7 million from royalties, rentals and bonuses collected in 1986 and prior years.

1998-2000: In 1987 Louisiana received an initial settlement payment of \$572 million from the escrow funds. A series of annual settlement payments have been disbursed to the states over a 15-year period along with an annual disbursement of 27 percent of royalty, rental, and bonus revenues received within each affected state's 8(g) zone. The annual settlement payments are: From 1987 through 1991, Louisiana received an annual settlement payment of \$2.52 million per year. From 1992 through 1996, the state received an annual settlement payment of \$5.88 million per year. Beginning in 1997 until the last payment in 2001, Louisiana will receive an annual settlement payment of approximately \$8.40 million per year.

2002 and After: No further settlement payments; states receive only a recurring annual disbursement of 27 percent of royalty, rental, and bonus revenues received within each affected state's 8(g) zone. Louisiana will receive an annual disbursement of 27 percent of royalty, rental, and bonus revenues received within Louisiana's affected 8(g) zone.

Gulf of Mexico Energy Security Act (GOMESA)

On December 20, 2006, the President signed into law the GOMESA of 2006 (Pub. Law 109-432). The Act significantly enhances OCS oil and gas leasing activities and revenue sharing in the Gulf of Mexico (GOM). The Act:

- A. Stipulated that 8.3 million acres be offered for oil and gas leases. This acreage is included in both the Central Gulf Planning Area and the Eastern Gulf Planning Area. The 8.3 million acres consist of approximately 2 million acres in the Central Gulf, it was the first that was offered for lease after enactment of the law and was included in Lease Sale 205 in October 2007; additional .5 million acres in the Eastern Gulf received additional environmental review and was offered in

Lease Sale 224 in March 2008; and the remaining 5.8 million acres in the Central Gulf was offered for leasing at Lease Sale 208 in March 2009.

- B. Updated moratoria (bans) areas in the Gulf. Those tracts in the Eastern Gulf of Mexico that are within 125 miles of Florida, all tracts east of the Military Mission Line, and tracts in the Central Gulf of Mexico within 100 miles of Florida that are included in the moratorium area which extends until 2022.
- C. Created revenue sharing provisions for four Gulf oil and gas producing States – Alabama, Louisiana, Mississippi and Texas, and their coastal political subdivisions. There are two phases in the GOMESA revenue sharing.
 - a. Phase 1: Beginning in Fiscal Year 2007, 37.5 percent of all qualified OCS revenues, including bonus bids, rentals and production royalty, will be shared among the four States and their coastal political subdivisions from those new leases issued in the 181 Area in the Eastern planning area (also known as the 224 Sale Area) and the 181 South Area. Additionally, 12.5 percent of revenues are allocated to the Land and Water Conservation Fund (LWCF). The final regulations for Phase I revenue sharing were issued on December 23, 2008 and specify that the Bureau intends to disburse funds on or before March 31st of the fiscal year following the fiscal year to which the qualified OCS revenues were attributed..
 - b. Phase 2: The second phase of GOMESA revenue sharing begins in Fiscal Year 2017. It expands the definition of qualified OCS revenues to include receipts from GOM leases issued either after December 20, 2006, in the 181 Call Area, or, in 2002–2007 GOM Planning Areas subject to withdrawal or moratoria restrictions. A revenue sharing cap of \$500 million per year for the four Gulf producing States, their CPS's and the LWCF applies from fiscal years 2016 through 2055. The \$500 million cap does not apply to qualified revenues generated in those areas associated with Phase I of the GOMESA program. The Bureau will address the second phase of GOMESA revenue sharing in a subsequent rulemaking.
- D. Allowed for the exchange of existing leases in the moratorium areas for bonus or royalty credit to be used in the Gulf of Mexico. A credit will be provided to lessees who relinquish certain eligible leases in the Gulf of Mexico. Leases are considered eligible if they lie within 125 miles of the Florida Coast in the Eastern Planning Area or within 100 miles of the Florida Coast in the Central Planning Area. The lessees will be allowed to use the credits in lieu of monetary payment for either a lease bonus bid or royalty due on oil and gas production from most other leases in the Gulf of Mexico or transfer the credits to other Gulf of Mexico lessees for their use.

Appendix C

Glossary

Bonus. A cash payment by the lessee for the execution of a lease. A lease is a contract that gives a lessee the right: (a) To search for minerals, (b) to develop the surface for extraction, and (c) to produce minerals within the area covered by the contract.

Casinghead Gas. All natural gas released from oil during the production of oil from underground reservoirs.

City-Gate. A point or measuring station at which a gas distribution company receives gas from a pipeline company or transmission system.

Commercial Consumption. Gas used by non-manufacturing organizations such as hotels, restaurants, retail stores, laundries, and other service enterprises. This also includes gas used by local, state, and federal agencies engaged in non-manufacturing activities.

Condensate. (See Lease Condensate)

Crude Oil. A mixture of hydrocarbons that existed in the liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities.

CRUDE OIL PRICES

Domestic Wellhead. The average price at which all domestic crude oil is first purchased.

Imports FOB. The price actually charged at the producing country's port of loading. It is the responsibility of the buyer to arrange for transportation and insurance.

Imports Landed. The dollar per barrel price of crude oil at the port of discharge. It includes crude oil landed in the U.S. and U.S. company-owned refineries in the Caribbean, but excludes crude oil from countries that export only small amounts to the United States. The landed price does not include charges incurred at the port of discharge.

Imports OPEC FOB. The average price actually charged by OPEC at their country's port of loading. This price does not include transportation or insurance.

OCS Gulf. The average price at which all offshore, Outer Continental Shelf, Central Gulf region crude oil is first purchased as reported by the U.S. Department of Energy, Energy Information Administration.

Refinery Acquisition Costs (RAC). The average price paid by refiners in the U.S. for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners.

a) **Domestic.** The average price of crude oil produced in the United States or from the Outer Continental Shelf of the U.S.

b) **Imports.** The average price of any crude oil not reported as domestic.

Refinery Posted. The average price from a survey of selected refiners' postings for Light Louisiana Sweet (LLS) crude, which is effective at the middle and at the end of the month.

Severance Tax. The average wellhead price calculated from oil severance taxes paid to the Louisiana Department of Revenue and Taxation.

Spot Market. The spot market crude oil price is the average of daily Light Louisiana Sweet (LLS) crude price futures traded in the month and usually includes transportation from the producing field to the St. James, Louisiana terminal.

State. The average price at which all Louisiana crude oil, excluding Louisiana OCS, is first purchased as reported in a survey by the U.S. Department of Energy, Energy Information Administration.

State Royalty. The average wellhead price from its royalty share of oil produced in state lands or water bottoms. The price is calculated by the ratio of received oil royalty gross revenue divided by royalty volume share reported to the Louisiana Department of Natural Resources.

Developmental Well. Wells drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

Dry Gas. (See Natural Gas, "Dry")

Dry Hole. An exploratory or developmental well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well.

Electric Utility Consumption. Gas used as fuel in electric utility plants.

Exploratory Well. A well drilled to find and produce oil or gas in an unproved area, to find a new reservoir in an old field, or to extend the limits of a known oil or gas reservoir.

Exports. Crude oil or natural gas delivered out of the Continental United States and Alaska to foreign countries.

Extraction Loss. The reduction in volume of natural gas resulting from the removal of natural gas liquid constituents at natural gas processing plants.

Federal Offshore or Federal OCS. (See Louisiana OCS)

Federal Onshore. They are lands in the United States for which ownership is claimed by the U.S. federal government, pursuant to Article Four, section 3, clause 2 of the United States Constitution.

FOB Price (Free on board). The price actually charged at the producing country's port of loading. The reported price includes deductions for any rebates and discounts or additions of premiums where applicable and should be the actual price paid with no adjustment for credit terms.

Gate. (See City-Gate)

Gross Revenue. Amount of money received from a purchaser, including charges for field gathering, transportation from wellhead to purchaser receiving terminal, and state production severance tax.

Gross Withdrawals. (See Natural Gas, Gross Withdrawals)

Imports. Crude oil or natural gas received in the Continental United States, Alaska, and Hawaii from foreign countries.

Industrial Consumption. Natural gas used by manufacturing and mining establishments for heat, power, and chemical feedstock.

Lease Condensate. A mixture consisting primarily of pentane and heavier hydrocarbons that is recovered as a liquid from natural gas in lease or field separation facilities, exclusive of products recovered at natural gas processing plants or facilities.

Lease Separator. A facility installed at the surface for the purpose of: (a) Separating gases from produced crude oil and water at the temperature and pressure conditions of the separator, and/or (b) separating gases from that portion of the produced natural gas stream which liquefies at the temperature and pressure conditions of the separator.

Louisiana OCS. Submerged lands under federal regulatory jurisdiction that comprise the Continental Margin or Outer Continental Shelf adjacent to Louisiana and seaward of the Louisiana Offshore region.

Louisiana Offshore. A 3-mile strip of submerged lands under state regulatory jurisdiction located between the State coast line and the OCS region.

Louisiana Onshore. Region defined by the State boundary and the coast line.

Major Pipeline Company. A company whose combined sales for resale, and gas transported interstate or stored for a fee, exceeded 50 million thousand cubic feet in the previous year.

Marketed Production. (See Natural Gas, Marketed Production)

Natural Gas. A mixture of hydrocarbon compounds and small quantities of various non-hydrocarbons existing in the gaseous phase or in solution with crude oil in natural underground reservoirs at reservoir conditions. The principal hydrocarbons usually contained in the mixture are methane, ethane, propane, butanes and pentanes. Typical non-hydrocarbon gases that may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide and nitrogen. Under reservoir conditions, natural gas and the liquefiable portions occur either in a single gaseous phase in the reservoir or in solution with crude oil, and are not distinguishable at the time as separated substances.

Natural Gas, "Dry". The actual or calculated volume of natural gas which remains after: (a) The liquefiable hydrocarbon portion has been removed from the gas stream, and (b) any volumes of non-hydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable.

Natural Gas, Gross Withdrawals. It is the full well-stream volume, including all natural gas plant liquids and all non-hydrocarbon gases, but excluding lease condensate.

Natural Gas Liquids. Lease condensate plus natural gas plant liquids.

Natural Gas, Marketed Production. Gross withdrawals less gas used for pressurizing, quantities vented and flared, and non-hydrocarbon gases removed in treating or processing operations. It includes all quantities of gas used in field and processing operations.

Natural Gas, OCS Gas. OCS gas volume is as reported. Most are "dry" gas, though some are "wet" gas.

Natural Gas Plant Liquids. Those hydrocarbons remaining in a natural gas stream after field separation and later separated and recovered at a natural gas processing plant or cycling plant through the processes of absorption, adsorption, condensation, fractionation or other methods. Generally such liquids consist of propane and heavier hydrocarbons and are commonly referred to as condensate, natural gasoline, or liquefied petroleum gases. Where hydrocarbon components lighter than propane (e.g., ethane) are recovered as liquids, these components are included with natural gas liquids.

NATURAL GAS PRICES

Henry Hub Settled NYMEX. The last trading day price for the month before delivery posted in the New York Mercantile Exchange for natural gas at Henry Hub.

Spot Market. The average price of natural gas paid at the regional spot market receipt points or zones as reported by the Energy Intelligence Group's NATURAL GAS WEEK. The data are a volume weighted average and reflect market activity information gathered during the entire month before the publication date, regardless of delivery date. The data are not an arbitrary weighting by production zone, but a true deal-by-deal volume weighting of prices gathered. Data prior to October 2002 were from Dynegey's survey of the domestic natural gas spot market receipt points or zones located in Louisiana. The new and old points or zones are as follows:

NATURAL GAS PIPELINES AND SALES POINTS FOR PRICES

<u>Dynegey</u>	<u>Natural Gas Week</u>
ANR	ANR
Eunice, LA	Patterson, LA
COLUMBIA GULF	COLUMBIA GULF TRANSMISSION CO.
Average Louisiana onshore laterals	Average of Erath, Rayne, and Texaco Henry Plant in Louisiana
LOUISIANA INTRASTATES	LOUISIANA INTRASTATES
Average of Faustina, Bridgeline, LIG, and Monterrey pipelines	Average of LIG, Bridgeline, LRC, and Acadian pipelines
SOUTHERN NATURAL	SONAT
South Louisiana	Saint Mary Parish, LA
TENNESSEE GAS	TENNESSEE GAS
Vinton, LA	Average Zone 1 of 500 & 800
TEXAS GAS TRANSMISSION	TEXAS GAS TRANSMISSION
Zone 1 (North Louisiana)	Zone 1 (North Louisiana)
GULF SOUTH PIPELINE	TRUNKLINE GAS CO.
	HENRY HUB

OCS. The average wellhead price calculated from sales and volumes from Louisiana OCS natural gas as reported by the U.S. Department of Interior, Office of Natural Resources Revenue.

State Royalty. The average wellhead price calculated from revenue received and volumes reported to the Louisiana Department of Natural Resources.

State Wells. The average price of gas sold at Louisiana wellhead. This price includes: (a) Value of natural gas plant liquids subsequently removed from the gas, (b) gathering and compression charges, and (c) state production, severance, and/or similar charges.

MAJOR PIPELINES PURCHASES.

a) **Domestic Producers.** The average price of natural gas produced in the United States or from the Outer Continental Shelf of the U.S.

b) **Foreign Imports.** The average price of any natural gas not reported as domestic.

Wellhead. The wellhead sales price including: (a) Value of natural gas plant liquids subsequently removed from the gas, (b) gathering and compression charges, and (c) state production, severance, and/or similar charges.

Natural Gas Plant Liquids (NGPL). NGPL are those hydrocarbons in natural gas that are separated as liquids at natural gas processing, fractionating, and cycling plants. Products obtained include ethane, liquefied petroleum gases (propane, normal butane, and isobutene), and natural gasoline. Component products may be fractionated or mixed. Lease condensate and plant condensate are excluded. Cycling plants are classified as gas processing plants or facilities designed to recover natural gas liquids from a stream of natural gas that may or may not have passed through lease separators and/or field separation facilities. These facilities control the quality of the natural gas to be marketed. Note: Some EIA publications categorize NGPL production as field production, in accordance with definitions used prior to January 2014.

Natural Gas, Wet After Lease Separation. The volume of natural gas, if any, remaining after: (a) Removal of lease condensate in lease and/or field separation facilities, and (b) exclusion of non-hydrocarbon gases where they occur in sufficient quantities to render the gas unmarketable. Also excludes gas returned to formation in pressure maintenance and secondary recovery projects and gas returned to earth from cycling and/or gasoline plants. Natural gas liquids may be recovered from volumes of natural gas, wet after lease separation, at natural gas processing plants.

Organization of Petroleum Exporting Countries (OPEC). Countries that have organized for the purpose of negotiating with oil companies on matters of oil production, prices, and future concession rights. Current members are Algeria, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

Outer Continental Shelf (OCS). All submerged lands that comprise the Continental Margin adjacent to the U.S. and seaward of the state offshore lands. Production in the OCS is under federal regulatory jurisdiction and ownership.

Processing Plant. A facility designed to recover natural gas liquids from a stream of natural gas which may or may not have passed through lease separators and/or field separation facilities. Another function of natural gas processing plants is to control the quality of the processed natural gas stream.

Proved Reserves of Crude Oil. As of December 31 of the report year, the estimated quantities of all liquids defined as crude oil which geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions. Volumes of crude oil in underground storage are not considered proved reserves.

Proved Reserves of Lease Condensate. The volumes of lease condensate as of December 31 of the report year expected to be recovered in future years in conjunction with the production of proved reserves of natural gas as of December 31 of the report year.

Proved Reserves of Natural Gas. The estimated quantities of natural gas as of December 31 of the report year which analysis of geologic and engineering data demonstrates with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions. Volumes of natural gas in underground storage are not considered proved reserves.

Proved Reserves of Natural Gas Liquids. The volumes of natural gas liquids (including lease condensate) as of December 31 of the report year, which analysis of geologic and engineering data demonstrates with reasonable certainty to be separable in the future from proved natural gas reserves under existing economic and operating conditions.

Rental. Money paid by the lessee to maintain the lease after the first year if it is not producing. A lease is considered expired when rental is not paid on time on an unproductive lease.

Reservoir. A porous and permeable underground formation containing an individual and separate natural accumulation of producible hydrocarbons (oil and/or gas) which is confined by impermeable rock or water barriers and is characterized by a single natural pressure system. Reservoirs are considered proved if economic producibility is supported by actual production or conclusive formation tests (drill stem or wire line), or if economic producibility is supported by core analysis and/or electric or other log interpretations. The area of a gas or oil reservoir considered proved includes: (a) That portion delineated by drilling and defined by gas-oil and/or gas-water contacts, if any; and (b) the immediately adjoining portions not yet drilled, but which can be reasonably judged as economically productive on the basis of available geological and engineering data.

Residential Consumption. Gas used in private dwellings, including apartments, for heating, cooking, water heating, and other household uses.

Royalty Interest. Those interests which entitle their owner(s) to a share of the mineral production from a property or to a share of the proceeds from there. These interests do

not contain the rights and obligations of operating the property and normally do not bear any of the costs of exploration, development, or operation of the property.

Royalty Override (Or Overriding Royalty). An overriding royalty interest is a percentage of oil and gas revenue from a producing well free of all drilling and producing costs. It is carved out of the lessee's or working interest owner and paid by the lessee or working interest owner. It is limited in duration to the terms of an existing lease, not subject to any of the expenses of development, operation or maintenance, and not connected to an ownership of minerals under the ground, and it is royalty in addition to the usual landowner's royalty reserved to the lessor.

Severance Tax. It is levied on production of natural resources taken from land or water bottoms within the territorial boundaries of the state. The state collects no severance from production in federal waters in the Gulf which start three miles from the Louisiana coastline. Natural resources are all forms of timber, including pulp woods, and turpentine and other forest products; minerals such as oil, gas, natural gasoline, distillate, condensate, casinghead gasoline, sulphur, salt, coal, lignite, and ores; also marble, stone, gravel, sand, shells, and other natural deposits; and the salt content in brine.

State Offshore. (See Louisiana Offshore)

Wet After Lease Separation. (See Natural Gas, Wet After Lease Separation)

LOUISIANA REVOLVING LOAN FUND PROGRAM

by
Buddy Justice

The Louisiana Department of Natural Resources (DNR) manages the State Energy Program (SEP) under a grant provided by the U.S. Department of Energy (DOE). Congress created DOE's State Energy Program in 1996 by consolidating two other programs: The State Energy Conservation Program (SECP) and the Institutional Conservation Program. Both programs went into effect in 1975. The State Energy Program provides grants to states and U.S. territories to promote energy conservation and reduce the growth of energy demand in ways that are consistent with national energy goals. SEP is the only EERE sponsored activity that encompasses renewable energy and energy efficiency technologies and addresses all sectors of the economy. The goals established for the SEP are: Increase energy efficiency to reduce energy costs and consumption for consumers, businesses and government; reduce reliance on imported energy; improve the reliability of electricity and fuel supply and the delivery of energy services; reduce the impacts of energy production and use on the environment. As part of the DOE SEP grant, DNR created the Louisiana Revolving Loan Fund Program to encourage the development, implementation and deployment of cost-effective energy efficient products, compressed natural gas (CNG) refueling stations and vehicles, and renewable energy projects in Louisiana, and also to support the creation of additional employment opportunities and other economic development benefits.

The current round of DNR funds became available for loans to be awarded under these Program Guidelines on January 1st, 2020. This will be a competitive funding process. The Revolving Loan Fund offers Louisiana domiciled public entities assistance in implementing eligible projects from inception to completion. The Program will provide access to low-interest rate loans for eligible entities to implement eligible projects at public facilities. This loan program is being administered through the Louisiana Public Facilities Authority (LPFA). LPFA charges a 2% loan closing fee with an additional 1/2 of a percentage point paid annually to service the loan. DNR charges 2% simple interest for the 10-year life of the loan or until paid in full. Interest is calculated from the closing date as based upon a 360-day year. No prepayment penalties are incurred for early payments.

Under the Louisiana Revolving Loan Fund, eligible applicants are public entities located within the State of Louisiana. Applications from the residential sector (homeowners) are not eligible for loan funding.

This Program will fund energy efficiency and renewable energy projects as deemed appropriate by DNR. Preference will be given to projects initiated by schools, hospitals, local parishes, or state governmental subdivisions.

Projects must be located within the state of Louisiana. Eligibility is limited to certain project costs for the purchase and installation of energy efficiency measures, CNG, and renewable energy equipment. Eligible projects are limited to the following types:

1. Funding energy efficiency retrofits, provided that projects are limited to: Installation of insulation; installation of energy efficient lighting; HVAC upgrades; weather sealing; purchase and installation of ENERGY STAR appliances; replacement of windows and doors; high efficiency shower/faucet upgrades; and installation of solar powered appliances with improved efficiency.

2. Installation of CNG refueling equipment; purchase of CNG vehicles (incremental costs only); CNG conversions. Including the purchase of new CNG school buses or the conversion of current buses to CNG power.
3. Purchase of new clean diesel powered school buses.
4. Installation of renewable energy technologies, as deemed appropriate by DNR.

Copies of the Guidelines and Application Packets may be obtained by Writing to:

Louisiana Department of Natural Resources
Technology Assessment Division, Suite 1272E
Louisiana Revolving Loan Fund Program
P.O. Box 94396
Baton Rouge, LA 70804-9693

E-Mail Request to:

larlf@la.gov

Downloading from our Website:

www.dnr.louisiana.gov/larlf

Please note that all requests must include a contact name, company name, mailing address, email address, telephone number, and fax number.

Applications must be sent to the address above, or received at the email address above no later than 3:00 p.m. CST on April 30, 2020 (closing date) after which time they will not be accepted. It is the position of the Department of Natural Resources that receipt of the completed electronic application forms no later than 3:00 pm CST on April 30, 2020 at the e mail address provided in the Program Requirements and Guidelines (larlf@la.gov) will suffice as having met the program guideline deadline.

LOCAL NON-PROFIT CELEBRATES 20 YEARS OF REDUCING LOUISIANA’S TRANSPORTATION EMISSIONS

by
Ann Vail and Victoria Hermann

Louisiana Clean Fuels (LCF) is celebrating its 20th anniversary as a US Department of Energy designated Clean Cities Coalition. Nearly 100 local coalitions serve as the foundation of Clean Cities by working in communities across the country to advance affordable domestic alternative fuels, fuel-saving technologies and practices, and energy efficient mobility systems. Each coalition is led by an on-the-ground Clean Cities coordinator who tailors projects and activities to capitalize on the unique opportunities within their communities. Nationwide, nearly 15,000 stakeholders participate in Clean Cities coalitions, and through their collective efforts, they are transforming local and regional transportation markets. Louisiana Clean Fuels, one of two Clean Cities coalitions in Louisiana, is a non-profit organization that receives support from the Louisiana Department of Natural Resources and its member organizations.

Louisiana Clean Fuels’ mission is to advance the nation’s environmental, economic, and energy security by supporting local actions to diversify transportation fuel options. Over the past year, LCF was involved in advancing the adoption of alternative fuels across Louisiana and the installation of critical fueling infrastructure. LCF worked with various organizations across the state to help them apply for

both DERA (Diesel Emissions Reduction Act) funding and the final two rounds of Volkswagen Mitigation Trust funding. Additionally, the coalition published their DC Fast Charging Master Plan, which identifies optimal charging locations based on EV owner needs, traffic patterns, etc., with the goal of establishing an electric vehicle DC Fast Charging network that meets the Federal Highway Administration's guidelines for alternative fuel corridors. LCF worked throughout 2019 with the Louisiana Department of Environmental Quality (LDEQ) and electric utilities across the state to utilize this Master Plan to help inform decisions on the optimal placement of DC Fast Chargers along our interstate corridors. More information can be found at https://louisianacleanfuels.org/Louisiana_DC_Fast_Charging_Corridor.

LCF's accomplishments are also impressive by the numbers:

- LCF and its stakeholders have cumulatively reduced over 165,500 tons of greenhouse gas emissions since the organization began collecting data in 2009.
- LCF's stakeholders reported a record 9.6 million GGEs reduced by their 2018 activities, the largest GGE reduction in a single year that LCF stakeholders have ever reported.
- Fleets in the LCF territory reduced their NOx emissions (which contributes to the production of ground-level ozone), by 261,872 lbs in 2018 alone.

In 2019, LCF's outreach activities made a real impact:

- LCF hosted 3 Listening Sessions with natural gas fleets around the state to identify potential technology gaps and critical research needs to improve vehicle and infrastructure performance and usability.
- LCF conducted 23 hours of free alternative fuel safety 101 classes for first responders.
- The coalition certified 3 new fleets into their Green Fleets Certification Program, designed to help fleets improve the economic and environmental performance of their vehicle operations.
- LCF hosted 4 public EV showcase events to more than 300 attendees across the state as part of the Louisiana Electric Vehicle Roadshow.

For 2020, the coalition plans to work to support legacy alternative fuel fleets in their territory, specifically through workforce development and improving access to alternative fuel technician training for

these fleets. LCF also has plans to continue to work with the LDNR and LDEQ to assist VW Settlement funding awardees with their electric vehicle supply equipment (EVSE) projects to help them implement the installation of their EV charging equipment as well as continuing to work to improve fueling infrastructure for all alternative fuels.

As a part of this initiative, LCF plans to host several training sessions related to alternative fuels and advanced vehicle technologies covering topics such as EV charging infrastructure for medium- and heavy-duty EVs, developments in gaseous and liquid alternative fuels, and EV 101 workshops for local leaders to prepare for an electrified future. The coalition will also continue organizing and facilitating multiple-fuel and/or technology-specific listening sessions with fleets and other stakeholders to identify technology gaps and critical research needs to improve vehicle/infrastructure performance and usability.

LCF's 2020 programmatic priorities include:

- Encourage investment in renewables through education with ongoing projects like our “Waste to Fuel” Curriculum initiative
- Increase the efficiency of public and private fleets through programs such as LCF's Green Fleets Certification program and Light Duty EV Readiness Fleet Analysis
- Support legacy alternative fuel vehicle (AFV) fleets by conducting Listening Sessions, hosting technical trainings, and collaborating with members on funding proposals
- Improve fueling infrastructure by hosting regional AFV infrastructure meetings in addition to utilizing LCF's EV Charging Corridor Master Plan
- Support and empower our first responders by continuing to offer safety training to Louisiana first responders

This year also marks LCF's 20th anniversary as a designated Clean Cities coalition. Over the past two decades, LCF has grown from a territory of 5 parishes to now cover 57 parishes, and alternative fuel usage of LCF stakeholders has grown from mere thousands in 2009 to nearly 9 million gallons in 2018. In celebration of their 20th anniversary, LCF is hosting the Clean Fuels Golf Classic on March 13, 2020, at Pelican Point Golf & Country Club in Gonzales, LA and a Gala Awards Banquet in the fall of 2020.

The Clean Fuels Classic is a golf scramble meaning players of all ability and experience levels are welcome. The event will feature excellent food, a Bloody Mary bar, and, for players who get a hole-in-one at holes sponsored by the Parretti Family of Dealerships and Gerry Lane Chevrolet, two chances to win a new car! Individual and team tickets are on sale now at www.cleanfuelsclassic.com.

More about the accomplishments of Clean Cities coalitions nationally:

Since 1993, the cumulative energy impact of Clean Cities coalition activities has surpassed 9.8 billion gallons of gasoline equivalent (GGEs) through alternative fuel use, fuel economy improvements, idle-reduction measures, and other strategies. This is enough to drive the distance to the sun and back 1,008 times. In 2018, coalitions reported a total national inventory of nearly 950,000 AFVs, split among 10 fuel and technology types. Coordinators reported large increases in some vehicle technologies. Plug-in electric vehicles (PEVs) grew by 40% and represented the second largest vehicle fuel type in 2018 at 227,854 PEVs. The number of vehicles using renewable diesel grew by 43% to 11,000 vehicles. Hydrogen vehicles grew by 247% from a small base to 402 vehicles.

2020 STATE OIL AND GAS: PRODUCTION AND PRICE PROJECTIONS

by
Edward O'Brien, III, MBA, M.Ec.

Louisiana has produced oil and gas for more than a century. Oil and gas production are intimately linked with the economy of our state. Presently, Louisiana is the ninth largest producer of crude oil and the third largest producer of natural gas in the U.S., excluding the federal Outer Continental Shelf (OCS) production. Louisiana is second in per capita energy consumption and it is second in industrial energy consumption. The petrochemical and petroleum refining industries located in the state are the main reason for Louisiana's high-energy use. They are extremely energy intensive and rely on Louisiana's abundance of natural resources and relatively low energy prices. Despite the location of these industries, the bulk of the final consumption of their products is in other states as well as overseas.

Interesting benchmarks in Louisiana's oil and gas production history include the following – In 1910, the first freestanding, above-water platform was used in Caddo Lake, near Shreveport. In 1938, the first well over water was completed in the Gulf of Mexico near Creole, offshore Cameron Parish. In 1947, the first offshore oil well was completed out of sight from land in Ship Shoal Block 32 (south of Morgan City, Saint Mary Parish). In 1951, the first concrete-coated pipeline was laid in the Gulf of Mexico. In 1954, the state started to produce more natural gas (in terms of barrels of oil equivalents) than crude oil. In 2006, the Haynesville Shale started producing natural gas, making gas a predominant factor in new production. In 2010, Louisiana oil production slowly reversed its declining trend due to production from oil shale formations and enhanced recovery in mature fields. Since 2014, Louisiana oil production has resumed its decline due to lower oil prices, and cheaper production costs in other U.S. oil and gas shale fields.

Production Projections

Crude Oil

Louisiana state oil production, excluding federal OCS, showed an average decline of 2.3% per year over the past five years, but actual year-to-year change varied widely. In FY2012/2013, the falling oil prices slowed the production increase. In FY2013/2014, the continuously falling oil prices and production difficulties in the oil shale formations reversed the increase in oil production trends. In FY2014/2015, the decline continued due to low oil prices, lower demand, and high oil inventory in stock. In FY2015/2016, the decline continued due to low oil prices and shifting oil exploration from Louisiana to oil shale plays in Texas, which tend to have a higher rate of return on investment. The Trend continued through FY2017/2018, with production declining by 7.0%. FY 18/19 was essentially flat, with a decrease of 1.1%. The Department of Natural Resources (DNR) Technology Assessment Division short-term model for oil production shows a decrease of production due to eroding oil value. Figure 1 shows the projections for the next five years. If prices go over \$50 per barrel for an extended period, the projections will be closer to the high case trend, inverting the slope of the decline. If oil drops below \$20, then assume the lower case scenario will be in play.

Figure 1: Louisiana Historical and Projected Crude Oil Productions

Natural Gas

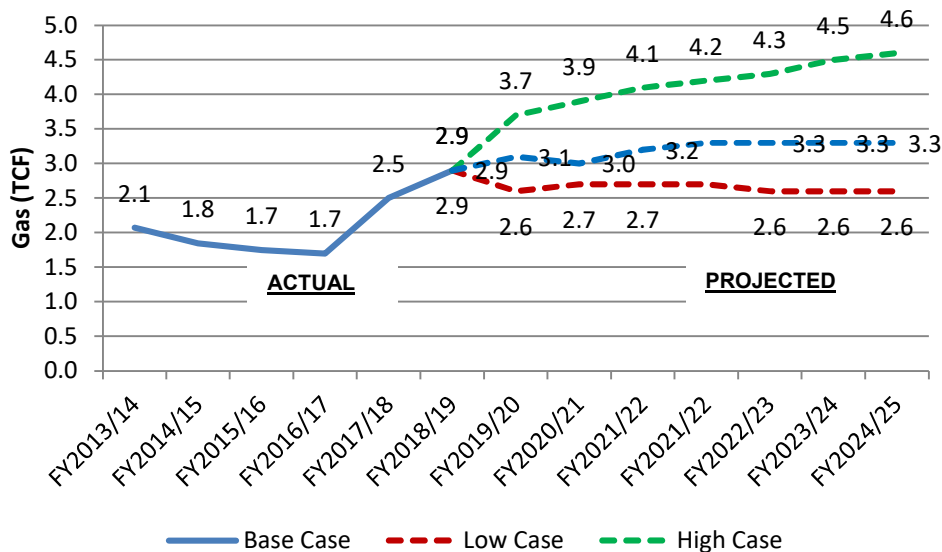

Similar to oil, gas production varies from year-to-year, reflecting the severity of weather patterns and prices. In FY2006/2007, the Haynesville Shale dry gas field appeared and changed the pattern. For example, the high decline in oil production in FY2008/2009 was due to Hurricanes Gustav and Ike, while gas production showed a slight increase. If there had been no hurricanes that year, the percentage of increase in production would have been higher. From FY2008/2009 through FY2011/2012, Louisiana state gas production more than doubled to around 3.0 TCF. In FY2012/2013, gas production dropped to 2.7 TCF, caused by a drop in drilling activities. In FY2013/2014, production dropped to 2.1 TCF due to low prices and competition from other gas shale plays. In FY2014/2015, gas production declined to 1.8 TCF, and in FY2015/2016, gas production declined to 1.7 TCF due to continuous low gas prices and low consumption. FY2016/2017 realized a slight increase in production, as renewed interest in the Haynesville spurred increased production. If FY2016/2017 showed a renewed interest, FY2017/2018 could be considered a renaissance, with production numbers not seen since the heyday of the Haynesville, with 2.5 TCF of production, a 47% increase in just one year. FY 18/19 continued the trend of increasing production with 2.9 TCF, an increase of 16%. Figure 2 shows the DNR Technology Assessment Division short-term model projections for the next five years. The projections assume that the weather will be mild without major disruptions and the average gas prices are above \$2.00 per MCF.

In 2012, the gas price fell below \$3 per MCF, initially causing a slowdown in drilling activities in the Haynesville Shale areas. There were 93 active rigs in Haynesville areas in January 2012, dropping to 16 active rigs by January 2013, an 82.8% decline. The drop in drilling activities, cutback in production due to low prices, competition from wet shale plays, and overstock of gas in storage curtailed the gas production in Louisiana. In January 2014, drilling active gas rigs recovered to 37 rigs, caused by rising gas prices, an expected demand increase, and exports. In January 2015, drilling gas rigs dropped to 25 rigs due to declining prices and improvements in drilling techniques. In January 2016, drilling rigs increased to 35 despite low gas prices, the increase can be attributed to the expectation of starting LNG export from Louisiana's LNG exporting terminals. In January 2017, drilling gas rigs dropped to 30 rigs,

even with rising oil and gas price, due to competition from other states shale plays that have lower gas wells drilling cost than in Haynesville shale plays or has oil shale wells producing high volume of gas. In January of 2018, rigs drilling for natural gas had increased to 45. January 2019 saw rigs around the same level in Haynesville. 2020 started a little slower than previous years, with only 31 rigs running in the Haynesville, which could be seen as a reflection of the natural gas price, which, at the time of writing this, was languishing under \$2/MCF. Factors that contribute to the year-to-year deviations in oil and gas production are:

- Changes in wildcat drilling and development of marginal fields within the state,
- adding new producing areas,
- unstable crude oil and natural gas prices,
- changes in environmental laws, especially those concerning saltwater discharge and the Clean Air Act Amendments of 1990,
- world supply and demand causing a glut or shortage, depending on its growth rate,
- the number of active drilling rigs in the region,
- application of advanced technology, such as 3-D, 4-D, or carbon dioxide injection,
- state and local tax incentives,
- weather patterns, and
- global pandemics.

Figure 2: Louisiana Historical and Projected Natural Gas Productions

Price Projections

Oil Prices

Oil prices are determined in the international markets and are difficult to project. Just as the historical data shows great swings in the price of oil, there is also considerable uncertainty about future prices. The future price of oil is linked to the unpredictability of world oil supplies and world economics.

Major factors affecting oil prices are a) political stability of producing countries, b) world environmental issues, c) industrialized countries conservation practices, d) weather-related demand for petroleum products, e) production curtailment by producing countries, f) economic changes in consumer nations, g) stability in the labor force, and h) new producing fields. If crude oil supply and demand for petroleum products is well balanced and refiners have sufficient downstream capacity to process difficult crudes, the price of crude oil will seek a stable market condition.

Oil prices started their most recent slide in the second half of 2014 as oil inventory built up. The buildup was caused by high production from oil shale plays; an increase from old fields using enhanced techniques; increased production in other producing countries; the slow recovery pace of the U.S. economy; and the regression of the Chinese economy. As of this writing, WTI was in the lower \$20s, due to the erosion of demand from the COVID-19 virus, which has decreased demand by an estimated 10-15 million barrels a day, compounded with the price war between Russia and Saudi Arabia, both of which have opened the proverbial spigots and are letting the oil flow. Saudi Arabia has pegged oil for their FY21 budget at \$12 per barrel, but, in the past, the Kingdom has underestimated the price of oil to gain more benefit later in the fiscal year.

Louisiana crude oil average price was \$106.36 per barrel in the spot market in February 2014, the price dropped to \$55.28 per barrel in February 2015, it dropped to \$32.48 in February 2016, and it sits at \$20.53 per barrel on March 25. Table 1 shows the historical Louisiana Crude Oil prices and the projection for the next five years.

Table 1: Louisiana Crude Oil Historical and Projected Prices

	Base Case		Low Case	High Case
FY2014/15	\$44.35	-41.82%	N/A	N/A
FY2015/16	\$46.94	5.84%	N/A	N/A
FY2016/17	\$59.66	27.10%	N/A	N/A
FY2017/18	\$67.54	13.21%	N/A	N/A
FY2018/19	\$47.45	-29.75%	\$42.63	\$54.32
FY2019/20	\$30.26	-36.23%	\$19.92	\$54.61
FY2020/21	\$34.34	13.48%	\$28.72	\$56.49
FY2021/22	\$36.66	6.76%	\$31.87	\$58.45
FY2022/23	\$38.44	4.86%	\$33.34	\$59.74
FY2023/24	\$39.88	3.75%	\$34.70	\$61.02
FY2024/25	\$44.35	-41.82%	N/A	N/A

GAS PRICES

Louisiana natural gas average spot price was \$5.96 per MCF in February 2014, the price dropped to \$2.85 per MCF in February 2015, it dropped to \$2.18 per MCF in February 2016, and is at \$1.66 per MCF on March 25. Table 2 shows the historical Louisiana Natural Gas prices and the projection over the next five years.

The physical relationship between the crude oil price and the natural gas price is the so-called “6-to-1” rule, where the price of one barrel of crude oil should be approximately six times the price of natural gas per million BTUs (MMBTUs). This is because the BTU content in a barrel of oil is about six times that of a million BTUs of natural gas. Natural gas prices recently started to diverge from this relationship, with the current ratio being 14:1. Gas has less mobility than oil in international trade because it requires special vessels and infrastructure (pipelines, compression stations, LNG terminals, etc.). Gas prices are cyclical, regional, controlled by supply and demand, and lack infrastructure for international trade. They are driven by factors such as weather, demand for gas not satisfied by pipeline systems, availability of spot supplies, and competing fuel prices. Others factors that could affect prices are storage levels, curtailments, market changes, and new consumption. Gas prices are also affected by psychological factors, often the expectation of soft prices is enough to bring them about, and a good dose of long, cold, winter weather will usually erase much of the psychological element of low gas prices and the price increases.

Table 2: Louisiana Natural Gas

	Base Case		Low Case	High Case
FY2015/16	\$2.15	-35.45%	N/A	N/A
FY2016/17	\$3.02	40.47%	N/A	N/A
FY2017/18	\$2.82	-6.62%	N/A	N/A
FY2018/19	\$2.93	3.90%	N/A	N/A
FY2019/20	\$1.96	-33.11%	1.83	2.25
FY2020/21	\$2.26	15.31%	\$1.98	\$2.56
FY2021/22	\$2.36	4.42%	\$2.12	\$2.67
FY2022/23	\$2.37	0.42%	\$2.09	\$2.75
FY2023/24	\$2.43	2.53%	\$2.15	\$2.89
FY2024/25	\$2.47	1.65%	\$2.21	\$2.94

Historical and Projected Prices

Louisiana annual average gas price is expected to be around \$2.25 per MMBTU in the near future, and to increase to around \$2.40 per MMBTU when demand increases from newly built plants in the state and when more LNG export terminals become fully operational.

SELECTED LOUISIANA ENERGY STATISTICS

Among the 50 states, Louisiana’s rankings (in 2018, unless otherwise indicated) were:

PRIMARY ENERGY PRODUCTION

(Including GOM Central OCS region)

- 2nd in crude oil
- 1st in OCS crude oil
- 1st in OCS natural gas
- 1st in OCS revenue generated for federal government
- 1st in mineral revenues from any source to the federal government
- 1st in LNG terminal capacity
- 3rd in natural gas
- 3rd in crude oil proved reserves
- 4th in natural gas proved reserves
- 8th in total energy from all sources

REFINING AND PETROCHEMICALS

- 2nd in primary petrochemical production
- 2nd in natural gas processing capacity
- 2nd in petroleum refining capacity

PRIMARY ENERGY PRODUCTION

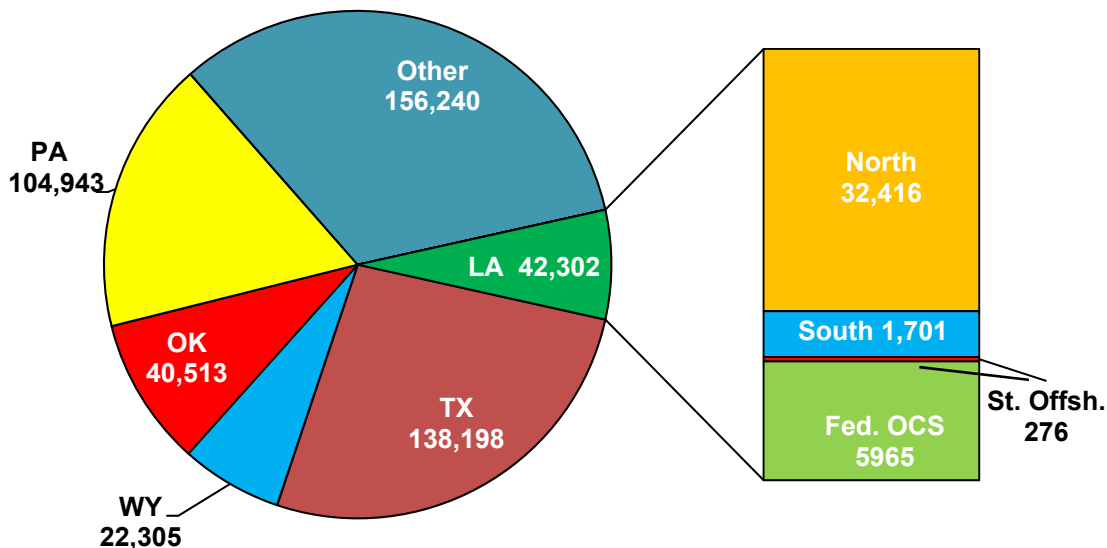

(Excluding GOM Central OCS region)

- 9th in crude oil
- 4th in natural gas
- 7th in natural gas proved reserves
- 9th in crude oil proved reserves
- 18th in coal
- 18th in nuclear electricity

ENERGY CONSUMPTION

- 1st in industrial energy
- 1st in per capita energy
- 3rd in natural gas
- 3rd in petroleum
- 4th in total energy
- 27th in residential energy

Figure 1
2018 U.S. Natural Gas Reserves
 (Billion Cubic Feet)

PRODUCTION

State controlled natural gas and casinghead gas production peaked at 5.6 trillion cubic feet (TCF) per year in 1970 and declined to 1.28 TCF in 2005. The trend started to reverse in 2006 when production increased to 1.35 TCF. The rising trend continued until 2011 when it peaked at 2.98 TCF. This production surge was due to production in the Haynesville shale play. Prior to the Haynesville discovery, the long-term decline rate was around 3.2% per year. With the start of production in Haynesville in 2007, the state production has shown an increase of 0.3% in 2008 over the previous year, 12.4% in 2009, 42.3% in 2010, and 37.1% in 2011. In 2012, production fell to 2.96 TCF; in 2013, it fell to 2.31 TCF; in 2014, it fell to 1.94 TCF; in 2015, it fell to 1.78 TCF; and in 2016, it fell to 1.72 TCF or a 3.2% drop from the previous year. In 2017, natural gas production began to see a resurgence, with 2.05 TCF produced, an increase of 19.2%. In 2018, the upturn continued, with 2.72 TCF produced, 1 TCF greater than just two years prior. And in 2019, 3.15 TCF was produced, the most since 1977.

State controlled crude oil and condensate production peaked at 566 million barrels (mmbbls) per year in 1970, declined to 211 mmbbls in 1980, declined to 148 mmbbls in 1990, declined to 107 mmbbls in 2000, and declined to 68 mmbbls in 2010. Then in 2011, oil production reversed its trend; 2011 production was 69 mmbbls, in 2012 it increased to 71 mmbbls, in 2013 it increased to 72 mmbbls, in 2014 it decreased to 69 mmbbls, in 2015 it decreased to 63 mmbbls, and in 2016 it decreased to 57 mmbbls. In 2017, production decreased another 10.0%, to 51 mmbbls. The production decrease is caused by low drilling activities. 2018 saw the decline continue, with 49 mmbbls produced in Louisiana. 2019 saw it decrease to 47 mmbbls.

Figure 2

Gulf of Mexico (GOM) Central OCS region is the most extensively developed and mature OCS territory in the U.S. It has produced approximately 94% of the 23 billion barrels of crude oil and condensate and 82% of the 207 TCF of natural gas extracted from all federal OCS territories, from the beginning of offshore production through the end of 2019.

In 2019, GOM Central OCS region produced 15.4% and the state territory produced 1.0% of the U.S. oil domestic production. The GOM Central OCS region produced 2.5% and the state territory produced 7.7% of the natural gas produced in the U.S.

GOM Central OCS region gas production first peaked at 4.10 TCF per year in 1981, then declined to 3.00 TCF in 1986, started to recover as prices increased, reaching a second peak at 4.11 TCF in 2010. Production then slowly started to decline, caused first by the moratorium on deep water drilling and later by the decline in price and increased gas shale production. In 2014, it produced 1.14 TCF; in 2015, it produced 1.07 TCF; and in 2016, it produced 1.09 TCF. In 2017, it produced 0.99 TCF, a decline of 0.1 TCF, or 9.1%. In 2018, the Central OCS region produced .97 TCF, down .02 TCF. In 2019, it produced 1.00 TCF.

GOM Central OCS region crude oil and condensate production first peaked at 374 mmbbls per year in 1972 and then declined to 249 mmbbls in 1981. The production rose from 248 mmbbls in 1990 to 524 mmbbls in 2001, due to the development of deep water drilling. In 2008, production dropped to 396 mmbbls due to weather; in 2009, production reached its second peak at 544 mmbbls; in 2011, production began to slow down after the Macondo oil spill and subsequent moratorium, but by 2014, production was on the upswing with discovery of deep oil reservoirs. The Central OCS produced 470 mmbbls in 2014, 514 mmbbls in 2015, and 534 mmbbls in 2016. In 2017, the Central OCS produced 582 mmbbls, an increase of 48 mmbbls. 2018 saw the Central OCS produce 611 mmbbls. 2019 gained another 49 mmbbls increase, totalling 660 mmbbls, in the Central OCS region.

REVENUE

In Fiscal Year (FY) 2007/08, oil and gas revenue (severance tax, royalties, and bonuses) reached an all time high of \$1.94 billion, or 16% of state income (total state taxes, licenses, and fees); the previous peak occurred in FY 1981/82 at \$1.62 billion, but it was 41% of state income. In FY 16/17 it was \$550 million. In FY 17/18 it was \$592 million. In FY 18/19, the state share was \$656 million. For FY 19/20, the amount is expect to come in at \$609 million.

DRILLING ACTIVITY

Drilling permits issued on state controlled territory peaked at 7,631 permits in 1984 and declined to a low of 1,017 permits in 1999. Since 2000, the annual number of drilling permits issued has been on a roller coaster ride. In 2008, they increased to 2,374 permits; in 2009, permits decreased to 1365; in 2010, they increased to 1,956 permits; in 2013, they decreased to 1,578 permits; in 2014, they decreased to 1,408 permits; in 2015, they decreased to 643; and, in 2016, they decreased to 475. In 2017, permits numbered 761, an increase of 60.2%. In 2018, they permits showed an uptick to 791 issued. In 2019, there was a decrease of 149 to 644 permits issued, a decline of 18.9%.

The average active rotary rig count for Louisiana, excluding OCS, reached a high of 386 active rigs in 1981 and fell to 76 active rigs in 2002. In 2008, there was an average of 117 active rigs. The count fell to 113 rigs in 2009. It increased to 166 active rigs in 2010 because of Haynesville run up; in 2014, it decreased to 60 active rigs due to competitions from shale productions; in 2015, the count decreased to 44 rigs; and, in 2016, it decreased to 26 rigs due to low oil and gas prices. In 2017, there was a bit of a rebound, averaging 42 rigs weekly, increasing by 61.5%. 2018 continued the modest improvement, increasing by 2 rigs on average to 44 rigs weekly over the year. 2019 saw a slight decrease to 41 state rigs, a decrease of 6.8%

The annual average active rotary rig count for GOM Central OCS region reached a high of 109 rigs in 2001 and it is in a downward trend; it was 70 rigs in 2006, 50 rigs in 2008, and 26 rigs in 2010. After the moratorium, the trend reversed; in 2013, it increased to 47 rigs; in 2014, it increased to 51 rigs; but, in 2015, it reversed to 33 rigs; and, in 2016, it decreased to 21 rigs. 2017, the annual average active rotary rig count decreased to 19, down by 2 from 2016. 2018 continued the downward trend in the OCS to 17 weekly rigs on average. 2019 saw the average increase by 4 in the OCS region off the Louisiana coast to 21, or a 23.5% increase.

HIGHLIGHTS OF THE 24th EDITION OF THE LOUISIANA CRUDE OIL REFINERY SURVEY REPORT

by
Edward O'Brien, III

The 23rd edition of the Department of Natural Resources (DNR) *Louisiana Crude Oil Refinery Survey Report* covers calendar year 2019. The 17 Louisiana refineries have a combined operating capacity of 3.99 million barrels per calendar day (MBCD), and the operating rate for that period was 95.7%. The total U.S. refinery-operating rate was 90.3% for the same period, with a combined operating capacity of 18,435 MBCD.

Louisiana's refinery capacity increased 0.3 MBCD from our last report. Louisiana refineries combined throughput for the 12-month period was 1.42 billion barrels. Marathon Petroleum Co., LLC at Garyville has the most refining capacity in Louisiana and it is the third largest refinery in the U.S. Table 1 shows the Louisiana operating refinery capacity and throughput information and Table 2 lists the top six refinery products based on percent of total refinery production from DNR's last survey. Motor gasoline remains the largest share of refinery production in Louisiana at about 40% of the total. The figure below shows the Louisiana Gulf Coast, Texas Gulf Coast and total U.S. refinery operating rates since 1991.

Louisiana Gulf Coast, Texas Gulf Coast and U.S. Refinery Operating Rates (%)

The full report is available online in PDF format later this year on the Department of Natural Resources Technology Assessment Division website: http://www.dnr.louisiana.gov/assets/TAD/reports/refinery_survey/RefineryReport_2019.pdf

Table 1. Louisiana Operating Refinery Capacity and Throughput

Refinery	Operating capacity as of 12/31/2019 (bcd)	Operating Capacity Change ¹ (%)	Throughput 1/1/2019 - 12/31/2019 (Barrels)	Throughput Change ² (%)
Alon Refining, Krotz Springs	78,500	-1.91%	28,041,262	31.39%

Lubricants	2.8

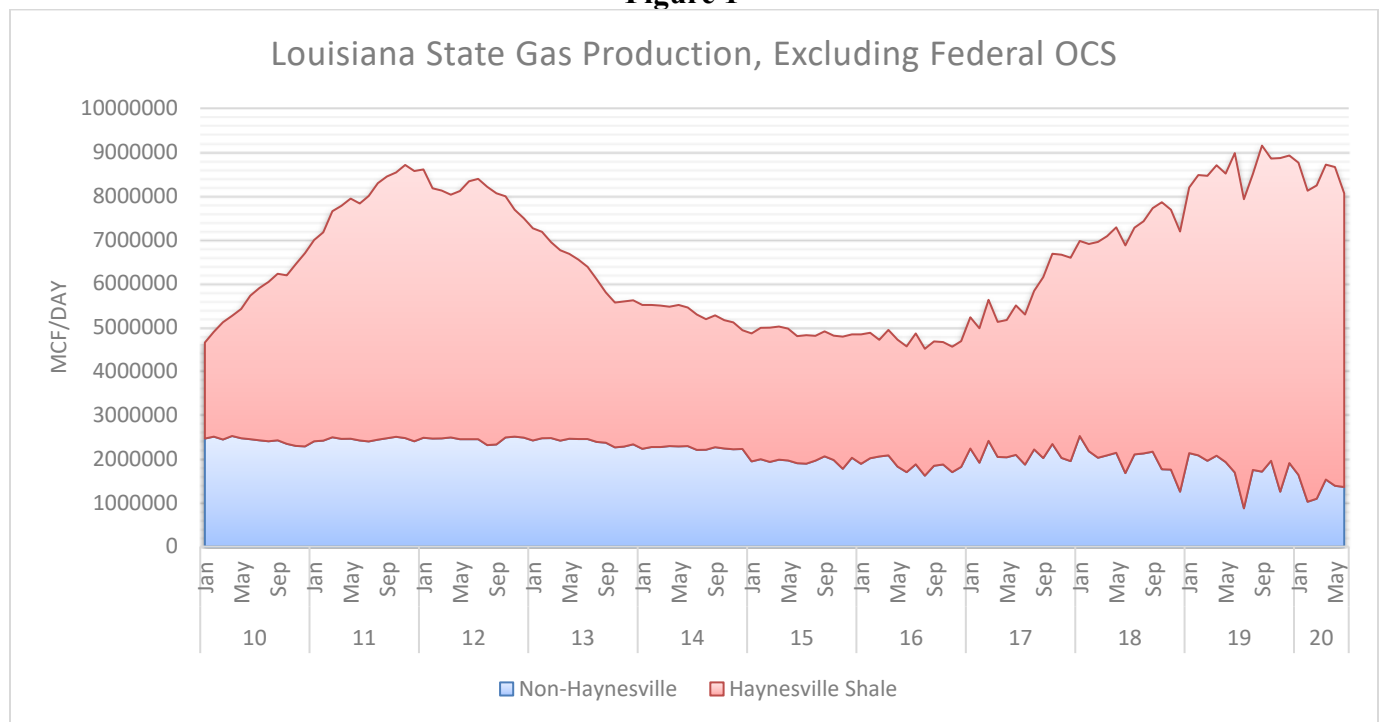

LOUISIANA STATE GAS PRODUCTION

by
Edward L. O'Brien, III, MBA, M.Ec.

Louisiana has been producing natural gas since the early 1900's. State gas production peaked in 1970 at 15.3 Billion Cubic Feet per day (BCF/d) and then declined until 2005, bottoming out at 3.3 BCF/d. This trend then reversed, thanks to production from Haynesville Shale exploration and production, and 2019 saw the largest production from the Haynesville since 2012, with projections for 2020 down due to COVID and the general demand decrease associated with the virus.

The Haynesville shale play is a layer of sedimentary rock more than 10,000 feet down in Northwestern Louisiana, Southwestern Arkansas, and Eastern Texas, with some of the play stretching well across the north central portion of Louisiana. Energy producers explored the shale play and drilled for crude oil and natural gas based on their potential for a large supply of oil or gas trapped within some portions of the shale play. Shale plays were once considered too costly due to the large amounts of ground water required to explore, but with the advent of technologically advanced equipment, less expensive technology in horizontal drilling, 3-D seismic, more efficient processes, and the ability to recycle water, moved the economic limit for production in the Haynesville to where it can be profitable.

Figure 1

Louisiana gas production average daily rate from 2010 to the present is shown in Figure 1. The Louisiana Haynesville Shale was producing more gas than the rest of the state by March 2010. In December 2011, Louisiana production reached a then record high of 8.7 BCF/d. In early 2013, as natural gas prices started to decrease, natural gas production in the Haynesville region was surpassed by production in the new developments in Marcellus and Utica Shale plays. These plays are located 6,000 to 6,500 feet below the surface, thus are cheaper to develop than the Haynesville wells. In late 2016, there was a renewed interest in the Haynesville, even with natural gas prices languishing between \$2 and \$3. Since then, the area has

seen even greater withdrawals than the boom period of the early 2010, surpassing those levels and propelling Louisiana to 9.1 BCF withdrawn per day in September, 2019.

Figure 2

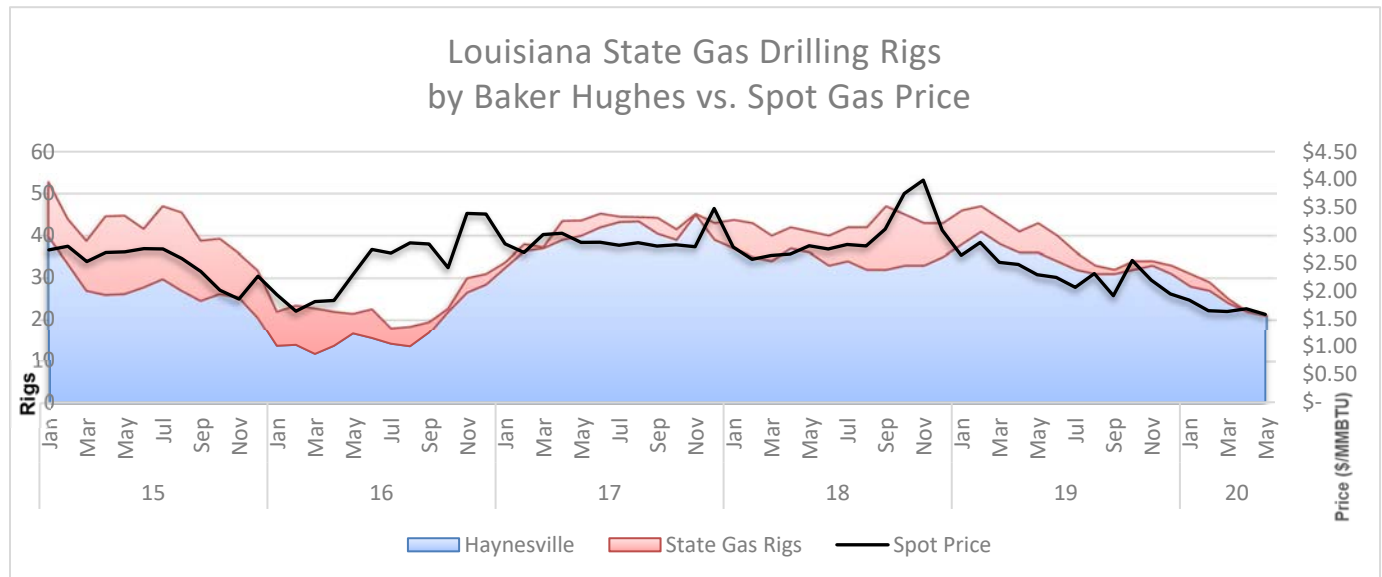

Figure 2 shows the relationship between gas prices and drilling rigs in Louisiana State excluding the federal OCS areas. Historically the data were highly correlated, lagging around 6 months, but from 2013 thru 2016, this relationship was broken. In those years, natural gas production in the Haynesville remained constant despite a declining number of drilling rigs. The increased production was due to the following improvements in drilling technology.

- **Longer laterals:** In the late 80's, small diameter 1,000 meters drilled crossing was a considerable achievement, but with development of bigger and better rigs, improvement in drill bits and better information on drilled rock strengths, laterals are now pushing lengths in excess of 5,000 meters.
- **Directional drilling:** Usage of geo-steering, a new technology in horizontal-directional drilling, keeping the wellbore in a particular section of a reservoir to minimize gas or water breakthrough, and maximize economic return; and the ability reach a larger area from one surface drilling location.
- **Increased drilling rates and drilled pipe diameters:** The new design in rotary steering systems and mud motors maximize rates of penetration and minimize downtime, and the high torque capability of new rigs, let them use larger diameter drill pipes and hole opening equipment.

Since late 2016, the correlation between price and drilling rigs recoupled. The recent increase in drilling activity has increased Louisiana gas production in the Haynesville to its highest output since 2012, and rivaling the output of the late 1970s. This production increase reflects an increase in demand from new industrial activities, expansion of existent gas plants, increasing gas usage in electric generations, and LNG exports, with Louisiana being a leader in each category.
