This edition of Cogeneration in Louisiana is funded 100% (\$470.91) with Petroleum Violation Escrow funds as part of the State Energy Conservation Program as approved by the U.S. Department of Energy and Department of Natural Resources.

This public document was published at a total cost of \$470.91. 100 copies of this public document were published in this second printing at a total cost of \$203.17. The total cost of all printings of this document, including reprints, is \$470.91. This document was published by the Department of Natural Resources, P.O. Box 94396, Baton Rouge, LA 70804-9396, to promulgate the State Energy Conservation Plan developed under authority of P.L. 94-163. This material was printed in accordance with the standards for printing by State agencies established pursuant to R.S. 43:31.

## **INTRODUCTION**

---

### **Purpose**

This report is primarily a statistical compilation and graphical representation of data relating to industrial cogeneration power sales to Louisiana electric utilities for the period 1985-1991, with special emphasis on 1991. A statistical overview of the Louisiana electric power industry is also provided. The purpose of this report is to provide the single, most complete reference source on the current status of cogeneration in Louisiana by furnishing statistical information and identifying trends that may be useful as analytical tools for electric utilities, current and potential cogenerators and independent power producers, planners, researchers, the media, libraries, and other interested parties.

### **Background**

About two-thirds of the industrial cogeneration projects now operating were completed during the mid-1980s. At that time the economic feasibility of cogeneration projects was most favorable and interest was high. Numerous inquiries by potential cogenerators for information on the subject were made to the Louisiana Public Service Commission (LPSC) and the Department of Natural Resources (DNR). Although the information requested was available in monthly reports filed by the electric utilities with the LPSC, it was not easily accessed and was presented in a format difficult to use. As a result each question had to be researched individually, a time-consuming process.

In 1986 the Technology Assessment Division of DNR decided to prepare a comprehensive report on cogeneration in Louisiana. The report was to include the information most frequently requested and would be updated periodically. The first report was published in March of 1987. Two more have since been published, the last one in June 1990.

This is the fourth report on cogeneration in Louisiana. It has been greatly expanded in scope to include additional information on cogeneration not contained in the previous reports plus summary statistics on the Louisiana electric power industry. It also updates and revises the data provided in all previous reports, which should be replaced.

### **Sources of Information**

The cogeneration information presented in this report was obtained from the monthly Cost-of-Fuel Adjustment Reports filed with the Utilities Division of the Louisiana Public Service Commission (LPSC) by the Louisiana electric utilities that purchase cogenerated power. In those few cases where these reports were incomplete, the information was obtained directly from the utilities. The LPSC also provided background information about the cogenerators and the utilities. There is no information in this report on cogenerators or non-utility generators that use all the power they generate internally.

The sources for the statistical summary on the Louisiana electric power industry were utility annual reports and financial reports, Edison Electric Institute and DOE/EIA publications.

### **Acknowledgment**

We would like to acknowledge the generous help and support given this project by the Utilities Division of the Louisiana Public Service Commission (LPSC), and particularly Arnold Chauviere, Jr. and his staff. Much of the information used to prepare this report was obtained through the auspices of the Utilities Division and references they provided. We sincerely appreciate their assistance.

## DISCUSSION

For the past several years the trend of cogeneration activity and electric power generation in Louisiana has mirrored the State's generally stagnant economy. While cogeneration purchases from Louisiana cogenerators have increased 50% since 1985, the average annual purchase price has declined nearly 36% (See Figure 1 and Tables 1 & 2). More recently, after peaking in 1987, cogeneration purchases have fallen 21% despite an increase in the number of cogenerators from 9 to 14 and an 11% increase in total net generation by the utilities (See Figures 2 & 3 and Table 3). Since 1988 the utilities' growth has been negligible, and the price of cogenerated power has declined nearly 10%.

Because Louisiana utilities have a sizeable capacity surplus, the price they are required to pay for cogenerated power is only the price of the fuel the utility avoids using by not generating the power itself. Since the mid-1980's, this "avoided cost" has steadily declined as the price of natural gas has fallen. A dwindling market and a falling price offer little incentive for additional cogeneration development.

In 1991 cogeneration sales by Louisiana cogenerators declined 9% as compared to 1990 while net electricity generation by all Louisiana generating sources fell slightly more than 1%. The price paid for the cogenerated power declined from an annual average of 2.03 cents/Kilowatthour (KWH) to 1.85 cents/KWH, or about 9%.

Since the last Cogeneration in Louisiana update in June 1990, there have been no new projects announced, but two Louisiana projects cited in that report have gone on-line. These are the 84 megawatt (MW) Exxon Chemical project and the 90 MW Formosa Plastics project. Gulf States Utilities is the purchasing utility. Both began operation in 1990, but Formosa did not actually sell power to Gulf States until 1991. These additions raised the total installed Louisiana cogeneration generating capacity to 1,421 MW.

Louisiana's total generating capacity consists of the operable generating plants within the state owned by the electric utilities and non-utility generators (NUGs). Electric utilities include investor-owned, publicly-owned, cooperatively-owned, and government-owned systems. NUGs include cogenerators and independent power producers (IPPs) that sell their power wholesale to the utilities. At the close of 1990, Louisiana's total generating capability was 18,164 MW. Of that total 16,551 MW was provided by the Louisiana generating plants of the utilities, 1,421 MW by cogenerators, and 192 MW by IPPs. A further breakdown by class of ownership and fuel mix is shown in Table 4.

In 1991 Louisiana's total net generation to the statewide power grid was 58,283 million KWH consisting of 57,136 million KWH generated by the utilities, 482 million KWH by cogenerators, and 665 million KWH by IPPs. A more detailed account of generation statistics by fuel type and type of operator is presented in Table 5. Although Louisiana cogenerators have almost 8% of the total statewide generating capacity, the power they sold to the utilities was less than 1% of the statewide total indicating that most of their generating capacity was used internally and not fed into the grid.

The primary fuel sources for almost 99% of the power produced by the Louisiana electric power industry are gas, coal, lignite and nuclear. Slightly more than 1% is generated by a hydroelectric plant owned by an IPP. Renewables, industrial by-products, and waste heat fuel a minute portion of cogenerated power. During the 1970's fuel oil was a significant source of electricity generation because of high gas prices and insecure availability caused by some unusual market dislocations including several severe winter cold snaps, poor deliverability, and gas curtailments to Louisiana industrial users ordered by the Federal Energy Regulatory Commission (FERC). In addition, the enactment of the Power Plant and Industrial Fuel Use Act of 1978 restricted the use of both oil and gas for power generation and large scale industrial boilers. Although these restrictions were eventually repealed, by 1981 both oil and

gas began to be displaced by coal and then by lignite and nuclear starting in 1985 to the point where today fuel oil use is negligible. A tabulation of the utilities' net generation by fuel type from 1960-1991 is shown in Table 3 and plotted in Figure 4 from 1973-1991.

Cogenerated power is purchased exclusively by the five investor-owned electric utilities that serve the state. They are Central Louisiana Electric Co. (CLECO), Gulf States Utilities (GSU), Louisiana Power & Light Co. (LP&L), New Orleans Public Service Co. (NOPSI), and Southwestern Electric Power Co. (SWEPCO). All are based in Louisiana except GSU, which is based in Beaumont, Texas. They had a combined Louisiana generating capability of 12,324 MW in 1991. Company addresses, 1991 generating capability, fuel mix, contacts and telephone numbers are shown in Table 6.

A total of 21 cogenerators sold electricity to Louisiana utilities in 1991, fourteen located in Louisiana and seven in Texas. The total installed capability was 1,421 MW for Louisiana cogenerators as previously stated and 291 MW for Texas cogenerators that sell power to Louisiana utilities for a total of 1,712 MW. Louisiana cogenerators accounted for almost 93% of the total power sold at nearly 482 million KWH while Texas cogenerators sold over 38 million KWH for a total of about 520 million KWH. Exact figures may be obtained from Table 1. Company addresses, contacts, telephone numbers, generating capacity, unit type, energy source, year of initial operation, and purchasing utility are listed in Table 7.

Both GSU and SWEPCO purchase cogenerated power from Texas cogenerators since the service area of both utilities includes portions of both states. In 1991, of the 370 million KWH of cogenerated power purchased by GSU, 334 million KWH, or about 90%, was purchased from Louisiana cogenerators and 36 million KWH from Texas cogenerators (See Tables 8A and 8B). All of SWEPCO's purchases were from Texas cogenerators because there are none in its Arkansas and Louisiana service territory (See Table 12).

By far, GSU is the largest purchaser of cogenerated power. In 1991 the company purchased over 71% of all cogenerated power purchased by Louisiana utilities. LP&L is next with slightly more than 28%. The other three utilities combined account for less than 1% (See Figure 5). The 1991 average purchase price the utilities paid for that power ranged from a low of 1.50 cents/KWH paid by LP&L to a high of 2.98 cents/KWH paid by SWEPCO. This and additional detailed data on cogeneration power purchases by all five utilities for the period 1985-1991 can be found in Tables 8A & B and Tables 9 thru 12.

In 1991 Dow Chemical sold the most cogenerated power at 144 million KWH. The purchasing utility was GSU, and the average purchase price was 1.61 cents/KWH. Average prices received by individual cogenerators for the power they sold in 1991 ranged from a low of 0.74 cents/KWH by Exxon Chemical to a high of 3.59 cents/KWH by Agrielectric. Since purchase contracts were not examined for this report, it is not known why there is such a wide range of prices. Annual cogeneration power sales and average sales prices for each cogenerator from 1985-1991 are tabulated in Tables 1 and 2 respectively.

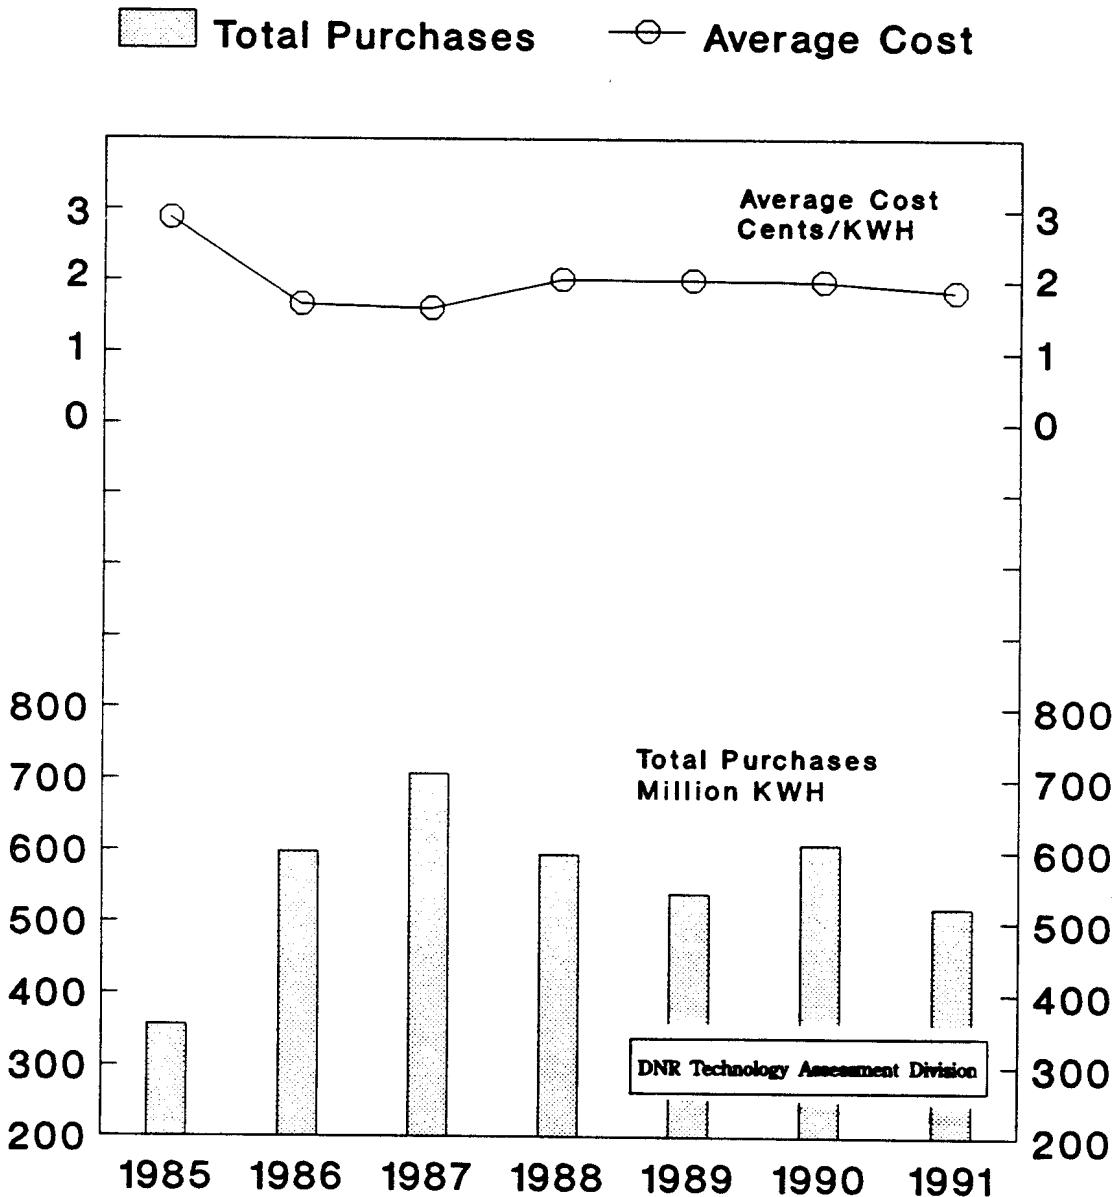

Given the present weak state of the Louisiana economy there is little incentive to invest in new cogeneration facilities intended to sell power off site to electric utilities. Louisiana utilities have ample generating capacity and do not project additional needs until the end of the decade. The decline of the purchase price also discourages additional cogeneration capacity. Moreover, the utilities are trying hard to keep their industrial load by offering lower industrial incentive rates to potential cogenerators. These rates appear to be low enough to render new cogeneration projects uneconomical. The Louisiana Public Service Commission (LPSC) has been receptive to this approach as a way to keep utilities' operating costs down and thereby forestall rate increase requests. From a potential cogenerator's perspective, in such an environment the most feasible cogeneration situation would be if the cogenerator had a year-round use for steam and could use all the power generated too.

In other parts of the country, but not Louisiana, significant portions of new capacity are being supplied by NUGs. According to the latest edition of the Utility Data Institute's "Directory of New Electric Power Plants", almost half of the 104,584 MW of new electrical capacity under construction or planned to enter service between 1990 and 2000 will be provided by IPPs. Many investor-owned utilities, stung by regulatory agencies' disallowances in their rate base of the costs of new generating facilities brought on-line in the 1980's, are unwilling to risk new capital for additional capacity and are opting for contracting for it with IPPs.

Louisiana's lone IPP is the 192 MW Sidney Murray Hydroelectric Station on the Mississippi River 70 miles below Vidalia on the control structure that regulates flow into the Atchafalaya River. It has a capacity of 192 MW and generated 665 million KWH in 1991. The facility is owned by Catalyst Old River Hydroelectric Limited Partnership and has been on-line since May of 1990. According to the LPSC, 94% of the power generated by the plant is purchased by LP&L with the remainder going to the town of Vidalia. The purchase price started at 6.5 cents/KWH escalating on a fixed schedule that peaks at 20.5 cents/KWH in 2010, and then drops over the next seven years to 15 cents/KWH, where it remains until 2031. While these prices appear to be very high compared to cogeneration prices, the purchase contract provides for rates from 3.00 cents/KWH to as low as zero for electricity that exceeds certain predetermined amounts during specific time periods. So far, operating rates have been significantly below these thresholds.

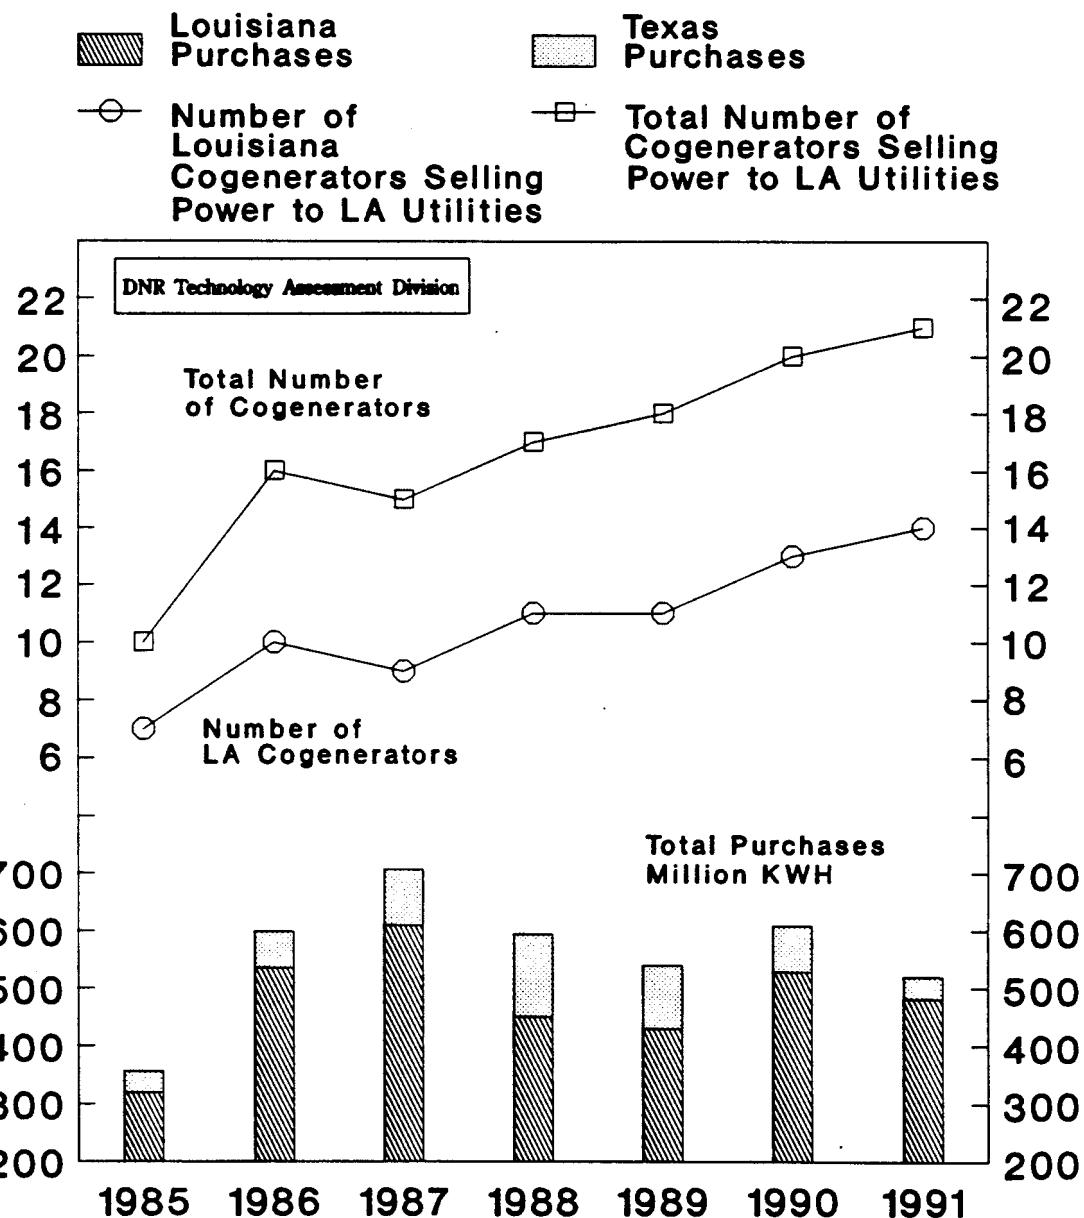

In conclusion, the combination of Louisiana's lackluster economy, flat electrical demand, generating overcapacity, low fuel prices, and low cogeneration purchase prices does not create an investment climate that is favorable to the development of additional cogeneration and IPP capacity in the near term. Unless the state's economic fortunes take a decided turn for the better, it could very well be the 21st century before new projects can be justified.

\* Some Texas utilities own a portion of generating facilities located in Louisiana and operated by a Louisiana utility. Sam Rayburn G & T, Inc., owns 10% (55 MW) and Sam Rayburn Municipal Power Agency owns 20% (110 MW) of the R.S. Nelson #6 generating plant. GSU operates the plant and owns the remaining 70% (385 MW).

\*\*Rice hulls, Off-process gas, Petroleum coke, Bagasse, Wood waste, Waste heat, Black liquor.

\*\*\* Individual percentage components may not total 100% because of independent rounding.

<b>CLECO</b>	Central Louisiana Electric Company, Inc.
<b>DNR</b>	Louisiana Department of Natural Resources
<b>DOE/EIA</b>	U.S. Department of Energy / Energy Information Administration
<b>FERC</b>	Federal Energy Regulatory Commission
<b>GSU</b>	Gulf States Utilities Company
<b>IPP</b>	Independent Power Producer
<b>KWH</b>	Kilowatthour (1 thousand watthours)
<b>LP&amp;L</b>	Louisiana Power & Light Co.
<b>LPSC</b>	Louisiana Public Service Commission
<b>MW</b>	Megawatt (1 million watts)
<b>NOPSI</b>	New Orleans Public Service Co.
<b>NUG</b>	Non-Utility generator
<b>PURPA</b>	Public Utility Regulatory Policies Act of 1978
<b>QF</b>	Qualifying Facility as defined by PURPA

## GLOSSARY

**Avoided Cost** - The incremental cost an electric utility avoids incurring by purchasing an equivalent amount of power from a qualifying facility (QF) instead of generating the power itself. This is the price electric utilities pay for a QF's output.

**Capability** - The maximum load that a generating unit, generating station, or other electrical apparatus can carry under specified conditions for a given period of time without exceeding approved limits of temperature and stress. In the context of this report the terms "Capability" and "Net Summer Capability" are interchangeable.

**Capacity** - The full-load continuous rating of a generator, prime mover, or other electric equipment under specified conditions as designated by the manufacturer. This report uses net summer capability as its statistic for measuring electric generator capacity. Therefore, all discussion of electric generator capacity in this report is based on the use of net summer capability data.

**Cogeneration** - The sequential production of electrical energy and useful thermal energy from the same fuel source.

**Cogenerator** - A cogeneration facility designated as a qualifying facility (QF) under PURPA. Only those Louisiana and Texas cogenerators that sell power to the five Louisiana investor-owned utilities listed in Table 6 are discussed in this report.

**Electric Power Industry** - The public, private, and cooperative electric utility systems of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including Generation and Transmission entities ("G and T's"); jointly owned electric utility facilities, and electric utility facilities owned by a lessor and leased to an electric utility. Excluded for this list are the special purpose electric facilities or systems that do not offer service to the public.

**Electric Utility** - An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include investor-owned, publicly-owned, cooperatively-owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems. An entity that solely operates qualifying facilities under the Public Utility Regulatory Policies Act of 1978 (PURPA) is not considered an electric utility.

**Fuel** - Any substance that can be burned to produce heat; also, materials that can be fissioned in a chain reaction to produce heat.

**Grid** - The layout of an electrical distribution system.

**Gross Generation** - The total amount of electric energy produced by the generating units at a generating station or stations, measured at generator terminals.

**Hydroelectric Plant** - A plant in which the turbine generators are driven by falling water.

**Independent Power Producer (IPP)** - A class of non-utility generator that builds power plants mainly to supply and sell power to electric utilities.

**Investor-Owned Electric Utility** - A class of utility ownership that is privately owned and organized as a tax paying business, usually financed by the sale of securities in the capital market.

**Kilowatt (KW)** - One thousand watts.

**Kilowatthour (KWH)** - One thousand watthours.

**Load (Electric)** - The amount of electric power delivered or required at any specific point or points on a system. The requirement originates at the energy-consuming equipment of the customers.

**Megawatt (MW)** - One million watts.

**Megawatthour (MWH)** - One million watthours

**Net Generation** - Gross generation less the electric energy consumed at the generating station for station use.

**Net Summer Capability** The steady hourly output which generating equipment is expected to supply to system load exclusive of auxiliary power, as demonstrated by tests at the time of summer peak demand.

**Non-Utility Generator (NUG)** - Cogenerators, small power producers, and other non-utility companies that produce power for their own use and for sale to electric utilities. They do not have a designated franchised service area and do not file forms listed in the Code of Federal Regulations, Title 18, Part 141.

**Operable** - A generating unit is operable when it is available to provide power to the grid. For a nuclear unit, this is when it receives its full power amendment to its operating license from the Nuclear Regulatory Commission.

**Power** - The rate at which energy is transferred. Electrical energy is usually measured in watts. The term is also used for a measurement of capacity.

**Privately Owned Electric Utility** - Same as investor-owned electric utility.

**Public Utility Regulatory Policies Act of 1978 (PURPA)** - One part of the National Energy Act, PURPA contains measures designed to encourage the conservation of energy, more efficient use of resources, and equitable rates. Principal among these were suggested retail rate reforms and new incentives for production of electricity by cogenerators and users of renewable resources.

**Publicly-Owned Electric Utility** - A class of ownership found in the electric power industry that includes those utilities operated by municipalities, and State and Federal power agencies.

**Qualifying Facility (QF)** - This is a cogenerator, small power producer, or non-utility generator that meets certain ownership, operating and efficiency criteria established by the Federal Energy Regulatory Commission (FERC) pursuant to PURPA, and has filed with the FERC for QF status or has self-certified. QF's are guaranteed that electric utilities will purchase their output at the utility's avoided cost. For additional information, see the Code of Federal Regulation, Title 18, Part 292.

**Renewable Energy Source** - An energy source that is regenerative or virtually inexhaustible. Typical examples are wind, biomass, geothermal and water power.

**Small Power Producer** - According to PURPA a facility limited to a capacity of 80 MW and generating electricity using renewable energy as a primary source. In 1990 the capacity limit was removed for certain specific energy sources.
