NLR is a tidal lake extension of Timbalier Bay originally developed in the late 1940s. The field is an anticlinal structure with reservoirs trapped by a combination of faults to the south/west and dip closures to the north/east. There are 17 producing horizons with three primary formations (Bigenerina, Cibicides, & Texularia "L") having multiple unitized zones. Multiple wells in the field were abandoned while productive and are still available (see back). For more information please contact the Louisiana Office of Mineral Resources.
