The Rabbit Island Field is located on the border of Iberia and St.Mary Parishes, at the southern end of Vermilion Bay and Atchafalaya Bay. The southern portion of the field extends into Louisiana State Offshore Waters of the Gulf of Mexico. Water depths across the field are generally 10 feet. The minerals are 100% vested with the State of Louisiana.

The field was held by State Lease 340, issued in 1936, and originally developed by Texaco, Inc. Approximately 311 wells have been drilled in the field. Cumulative production is approximately 1.2 Trillion Cubic Feet of gas and 51 Million Barrels of oil.

Structurally, the field is a large faulted anticline with a salt core. A narrow salt stock is reported to penetrate within 15 feet of the sea floor. Multiple sandstone reservoirs are productive at depths of 1,600 feet to 14,300 feet.

Currently, there are 44 orphan wells in the field where bypassed pays, re-entries and recompletions exists. In addition, there exist exploration and development opportunities for untested fault blocks, new field pays, and deeper pool tests.

There are also 5 inactive production platforms located within the field that can be utilized for processing facilities.
